

The overall goal of this ERD is to create a system that stores data for a mechanic service. It tracks cars, customers, mechanics, and jobs completed. Customers are linked to cars via a one to many-or-one relationship, so that one customer can have one or many cars. Cars are then linked to the work performed entity through a one to many-or-one relationship, so that one car can have at least one service performed on them. Lastly, mechanics are linked to work performed in a one to many-or-one relationship, so that one mechanic can have many or one jobs performed.

Every relationship is designed to assume that any part of the system has at least one entry, but is also capable of having multiple that apply to it. A customer can own one or, or multiple, but a car cannot have multiple owners. A mechanic can have worked on at least one job, but a job can't have multiple mechanics working on it.
